

I received the copy of your request to re-evaluate Bayonne Barrel & Drum with the new HRS. This site will be submitted for a site investigation prioritization (SIP). A quick review of the file material for the site suggests that BB & D does not have significant groundwater population targets within three miles, as well as no incidents of direct contact to contaminated soil. The site is surrounded by a fence. In addition, the nearest downslope surface water is the Passaic River and there are limited sensitive environments. There is a chance of contaminants discharging to surface waters via a stormwater discharge point. No records of air sampling exist.

We will perform the SIP, in order to see if the new HRS model offers a vehicle for determining whether this is a worst site. Under the old HRS this site was considered a NFRAP.
